

EMPLOYEE COMPUTER REQUIREMENTS EVALUATION FORM

Employee Name: John

Department / Role: Video Editing

Required By: Start Date

Employee Duties:

Video editor required to create high-resolution visual content, including 4K video formats.

Hardware and software should be capable of editing 4K videos with precise color grading and smooth playback.

High-performance network capabilities are required to complete tasks, as the employee will be working online.

The following specifications will provide John with the necessary equipment to complete his tasks.

STEP 1 – HARDWARE REQUIREMENTS

Type: CPU 8 or more cores

Reasoning: More cores help John process and render 4K video more efficiently.

Type: RAM 32 GB or more

Reasoning: 32 GB of RAM helps John work with large 4K video files and run multiple editing programs smoothly.

Type: GPU / Graphics Card 8 GB or more of VRAM.

Reasoning: 8 GB or more of VRAM helps the graphics card process 4K video, effects, and color grading smoothly.

Type: Storage 1 TB or larger NVMe SSD

Reasoning: A 1 TB or larger NVMe SSD gives John fast access to large 4K video files and enough space for active projects.

Type: 4K monitor with good color accuracy

Reasoning: A 4K color-accurate monitor helps John view high-resolution video clearly and perform accurate color grading.

Type: Large-capacity external SSD or HDD

Reasoning: An external drive gives John additional space for large video files and helps him back up completed projects.

STEP 2 – SOFTWARE REQUIREMENTS

Type: Adobe Premiere Pro

Reasoning: It allows John to edit, trim, color-grade, and export 4K video.

Type: Adobe Photoshop

Reasoning: It allows John to create and edit graphics, images, and thumbnails for video projects.

Type: Windows 11 64-bit

Reasoning: It supports modern hardware and professional video-editing software.

Type: Adobe After Effects

Reasoning: It allows John to create motion graphics, animated titles, and visual effects for video projects.

Type: Media codecs

Reasoning: They help John open, play, and export different video and audio file formats correctly.

Type: GPU driver

Reasoning: It helps Windows and the video-editing software communicate properly with the graphics card.

STEP 3 – NETWORKING REQUIREMENTS

Type: High-speed internet connection

Reasoning: That matters because John will be uploading, downloading, and sharing very large 4K video files online.

Type: Gigabit Ethernet

Reasoning: This gives John a fast, stable wired connection for uploading and downloading large 4K video files.

Type: Wi-Fi 6 or newer

Reasoning: This gives John a fast wireless option when Ethernet isn't available.

Type: Cloud storage or network storage.

Reasoning: This gives John a place to save, back up, and access large video files while working online.

Type: Secure login and access permissions.

Reasoning: This helps protect John's video files so only authorized people can access or change them.

Type: VPN

Reasoning: A VPN provides a secure connection to company files and resources when John is working online.

STEP 4 – Bringing It All Together

John should keep the projects he is actively editing on the 1 TB NVMe SSD because it is fast and can load and save large 4K files quickly. He should keep his backups and completed projects on external storage or cloud storage. This is important because the data will be safely stored, easily accessible, and backed up in more than one location in case one copy becomes corrupted or damaged. John should connect to Gigabit Ethernet when available because it is faster and more reliable than Wi-Fi. The video editing software allows him to edit, color-grade, and export 4K video. The GPU helps process video effects, playback, and color grading, while RAM helps John run large projects and multiple programs smoothly. The CPU handles the main processing work and helps render video efficiently. The 4K monitor allows him to see fine details and accurate colors when editing. Windows 11 64-bit supports modern hardware and professional editing software. The networking setup helps John upload, download, share, and access large video files reliably.
